Applicant's election with traverse of Group I including claims 1-2, 4-9, 13, 15, 17 and 19 in the reply filed on 20 October 2004 is acknowledged. The traversal is on the ground(s) that the claims of an application define the same essential characteristics of a single disclosed embodiment of an invention. This is not found persuasive because the claims of this application recite three groups having different purposes for inventions that would require further different considerations and/or searches.

The requirement is still deemed proper and is therefore made FINAL.

Rejection Under 35 U.S.C. 112, First Paragraph

Claims 1-2, 4-9, 13, 15, 17 and 19 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. Applicant is only claiming a single means, i.e. an ionization chamber, and not a combination of elements.

Rejection Under 35 U.S.C. 103(a)

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-2, 4-9, 13, 15 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mantkowski (5,075,966).

Mantkowski (5,075,966) discloses, in figs. 1A-4B, a rocket engine having a tubular combustion chamber 28 that can be made of a substrate with a surface layer forming the chamber therein. The substrate 10 can be super alloy such as Inconel 625, as well as, the layer 18 (see col. 4, lines 19-23 and col. 5, lines 15-18).

It is obvious to one skilled in the art that the combustion chamber in a rocket engine would produce a certain amount of ions from the ignition of the gas therein; and therefore the rocket engine can broadly be considered as an ionization chamber. Further, it is obvious that the thickness of the super alloy layer can be determined by anyone of ordinary skill in the art, depending upon the intended purpose of the ion source.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

1) Perkins (6,765,215) is the parent of the current application.
